Problem

The company needed virtual shared storage to achieve high availability (HA).

Solution

Thanks to StarWind vSAN, the company creates an HA storage pool and builds a flexible, scalable, and easy-to-manage hyperconverged IT infrastructure.

Problem

Before StarWind Virtual SAN (vSAN) deployment, Astral Brands had Direct Attached Storage (DAS) with VMware ESXi on top. The main problem was that DAS did not work with multiple ESXi hosts, so the company needed a virtual shared storage solution.

Solution

Astral Brands chose **StarWind vSAN** because of its ease of use and powerful technical features. Using StarWind vSAN, a high availability cluster was deployed, so now all the company's hosts can access the storage pool that was created. Besides, the company can move around virtual machines (VMs) across all servers. The current IT infrastructure powered by StarWind vSAN runs like clockwork and fully satisfies all the requirements.

Thanks to StarWind vSAN, we can now share storage across all our hosts in vCenter. For the money, your StarWind's solution is the best option out there.

Jason C., Director of IT
