Solution

StarWind Virtual SAN (vSAN)

"StarWind vSAN was easy to implement as well as to use. The Management GUI of the product is easy to understand. The overall cost of the product is also effective as compared to other virtualization solutions."

Senior SOC Analyst

Challenge

Before StarWind Virtual SAN (vSAN) deployment, Hilal Computers' IT infrastructure involved three blade servers running five virtual machines. Despite the relatively small scale, the performance issues and latency were affecting their operations significantly.

This resulted in delays and inefficiencies, impacting their ability to deliver real results to global businesses effectively. In search of a required solution, Hilal Computers evaluated various options and eventually selected StarWind vSAN because it offered a more robust and cost-effective alternative.

Solution

By implementing StarWind vSAN, Hilal Computers were able to overcome the latency challenges and significantly improve the overall performance of their critical applications. The solution provided the necessary support for their VMware hypervisor environment, ensuring seamless integration and streamlined management. StarWind vSAN was not only easy to implement but also user-friendly with its intuitive Management GUI.

The cost-effectiveness of the solution compared to other virtualization alternatives was an added advantage for the company, providing them with better value for their investment. Hilal Computers expressed their intentions to continue exploring and implementing other StarWind solutions.
