USA

Solution

StarWind Virtual SAN (vSAN)

"By using StarWind software, the client was no longer a victim of failing physical infrastructure (power and cooling issues). They were able to keep operating their business, even when issues arose that were outside the control of technology."

John Marta,
Company Representative

Challenge

Before StarWind Virtual SAN (vSAN) deployment, The Roscoe Company's client relied on standalone Microsoft Hyper-V hosts to run 12 virtual machines (VMs). However, their infrastructure lacked physical server host redundancy and faced power and cooling issues, putting their business operations at risk during outages.

After researching various options, The Roscoe Company chose StarWind due to its competitive price point, efficient functionality, and excellent support.

Solution

By implementing StarWind vSAN, The Roscoe Company creates a secondary hot site for their client's infrastructure, ensuring automatic failover of virtual servers. The latter would seamlessly transition to the secondary location during power outages, and once power was restored, data synchronization occurred to bring everything back to the primary environment. This approach met all requirements for business continuity.

The Roscoe Company intends to extend the benefits of StarWind's solution to more clients who seek reliable and redundant IT infrastructure.
