Problem

A need in a virtualization solution able to provide high availability in Azure for a storage-based cluster.

Solution

StarWind Virtual SAN has proven itself as a perfect solution providing shared storage high availability in Azure.

INTRO

Exakis has been the first Microsoft Partner in France. The company develops solutions based on Microsoft technologies combining design and innovation and helps its customers to develop innovative projects and information system security.

PROBLEM

Exakis required a system, which would be able to provide high availability. Being a Microsoft solution integrator, the company recently started offering Azure-based solutions to their customers more and more often. Shared storage volumes were used, thus, the demand for high availability arose.

SOLUTION

The company chose to test **StarWind Virtual SAN** in Azure because the product has already proven itself for them “on-premise”. They decided to try the solution themselves in order to recommend it to their customers afterwards. StarWind perfectly managed to meet the need for storage-based cluster high availability in Azure.
